

V_{out} in the illustrated embodiment of FIG. 12, the circuit 630 is a reset integrator operating as a form of transimpedance amplifier. The circuit 630 includes a differential amplifier 632 with the offset corrected current I_{out} provided to a first input thereof and a reference voltage V_{ref} coupled to the second input thereof. The feedback in turn is provided by a feedback capacitor 634. A reset switch 636 is also provided to reset the amplifier 632, in particular where circuit 630 is shared between a plurality of detector elements in a time multiplexed manner.

It will be appreciated by those skilled in the art that additional embodiments of a current to voltage conversion circuit 630 may be implemented including a more conventional transimpedance circuit employing a feedback resistor. The embodiment illustrated in FIG. 12 is preferred, however, for VLSI implementations due to the difficulty in implementing large resistor values accurately and uniformly in VLSI circuits.

While the foregoing detailed description of the invention has been provided in terms of specific embodiments and specific circuit implementations, it will be appreciated by those skilled in the art that such are merely illustrative in nature and a variety of modifications may be made while remaining within the scope of the present invention. Accordingly, the present invention should not be limited to the aforescribed preferred embodiments.

What is claimed is:

1. An infrared imaging system, comprising:
an infrared focal plane array comprising:
a plurality of infrared detector elements arranged in an array;
a readout circuit electrically coupled to the plurality of detector elements and comprising means for biasing the plurality of detector elements so as to provide separate detection signals corresponding to each detector element in the array, in response to incident infrared radiation and means for separately correcting offsets in the detection signals provided from the plurality of elements in the detector array to compensate for nonuniformities in the detector elements, wherein said means for correcting comprises:
a correction circuit including a plurality of parallel connected circuit elements; and
means for selectively electrically connecting said circuit elements into the detector readout circuit in response to stored offset correction values; and
output means for providing the corrected detection signals as an output of the focal plane array;
means for storing a plurality of offset correction values corresponding to the plurality of detector elements; and
means for providing the offset correction values to said means for correcting.
2. An infrared imaging system as set out in claim 1, wherein said plurality of parallel connected circuit elements comprise a plurality of capacitors.
3. An infrared imaging system as set out in claim 2, wherein said capacitors have capacitances of $2^N C_0$, respectively, where C_0 is a fixed capacitance and N is a nonnegative integer.
4. An infrared imaging system as set out in claim 3, wherein there are four capacitors having respective capacitances of C_0 , $2C_0$, $4C_0$ and $8C_0$.
5. An infrared imaging system as set out in claim 1, wherein said means for selectively connecting comprises a plurality of switches, equal in number to said plurality of parallel connected circuit elements and connected in series therewith.

Sub
A1

Sub
A2

6. An infrared imaging system as set out in claim 1, wherein said offset correction values are binary values and wherein said means for storing comprises a digital memory.

7. An infrared imaging system as set out in claim 6, wherein said digital memory stores a separate binary offset correction value for each detector element in the array.

8. An infrared imaging system as set out in claim 1, wherein said plurality of detector elements are arranged in a plurality of rows and columns and wherein said means for correcting comprises a separate offset correction circuit for each column and wherein said means for providing said offset correction values provides said offset correction values in a time multiplexed manner to said means for correcting.

9. An infrared imaging system as set out in claim 1, wherein said plurality of parallel connected circuit elements comprise a plurality of constant current sources.

10. An infrared imaging system as set out in claim 9, wherein said current sources provide substantially constant currents of $2^N I_0$, respectively, when coupled into said readout circuit by said means for selectively connecting, where I_0 is a fixed current value and N is a nonnegative integer.

11. An infrared imaging system as set out in claim 10, wherein there are four constant current sources providing substantially constant currents of I_0 , $2I_0$, $4I_0$ and $8I_0$.

12. An infrared imaging system as set out in claim 1, wherein said array of detector elements and said readout circuit are formed as a single monolithic integrated circuit chip.

13. An infrared imaging system as set out in claim 1, wherein said plurality of detector elements comprise microbolometer detector elements.

14. An infrared imaging system as set out in claim 13, wherein said means for biasing comprises a constant current source coupled to said microbolometer detector elements.

15. An infrared imaging system as set out in claim 13, wherein said means for biasing comprises a fixed voltage source coupled to said microbolometer detector elements.

16. An infrared imaging system as set out in claim 15, wherein said means for correcting comprises a plurality of substantially constant current sources selectively coupled to said voltage source and in parallel with said microbolometer detector elements.

17. An infrared imaging system as set out in claim 16, wherein said means for correcting further comprises a plurality of switches coupled in series with respective constant current sources.

18. An infrared imaging system as set out in claim 17, wherein said offset correction values comprise an on or off signal supplied to each of said switches.

19. An infrared imaging system as set out in claim 1, wherein said output means comprises one or more output buffers.

20. An infrared imaging system as set out in claim 1, wherein said focal plane array further comprises a differential amplifier with first and second inputs wherein the first input is electrically connected to the readout circuit so as to receive the detection signals and wherein the second input is connected to an adjustable reference voltage.

21. An infrared imaging system as set out in claim 1, further comprising timing means for providing focal plane timing signals to said readout circuit.

22. An infrared imaging system as set out in claim 21, wherein said readout circuit further comprises offset correction logic means for controlling the means for correcting in response to said timing signals provided from the timing means.

09667826-092100

sub P3

23. An infrared imaging system as set out in claim 22, wherein said offset correction logic means receives said offset correction values from said means for storing and provide them to said means for correcting in response to said timing signals.

24. An infrared imaging system as set out in claim 1, further comprising means, coupled to said output means, for analog to digital converting the corrected detection signals and providing corresponding image data for each detector element.

25. An infrared imaging system as set out in claim 24, further comprising a memory for temporarily storing image data corresponding to all the detector elements of the array.

26. An infrared imaging system, comprising:
 15 an infrared focal plane array comprising:
 a plurality of infrared detector elements arranged in an array;
 a readout circuit electrically coupled to the plurality of detector elements and comprising a plurality of readout cells equal in number to the plurality of detector elements, means for biasing the plurality of detector elements so as to provide separate detection signals corresponding to each detector element in the array, in response to incident infrared radiation and means for separately correcting offsets in the detection signals provided from the plurality of elements in the detector array to compensate for nonuniformities in the detector elements, wherein said means for correcting comprises an offset correction circuit in each readout cell of the readout circuit and wherein each offset correction circuit comprises a plurality of parallel connected circuit elements and means for selectively electrically connecting said circuit elements into the readout cell in response to a stored offset correction value corresponding to said readout cell; and
 output means for providing the corrected detection signals as an output of the focal plane array;
 means for storing a plurality of offset correction values corresponding to the plurality of detector elements; and
 means for providing the offset correction values to said means for correcting.

27. An infrared focal plane array, comprising:
 45 a plurality of detector elements configured in a two dimensional array; and
 a readout circuit electrically coupled to said plurality of detector elements and structurally integrated therewith, said readout circuit comprising:
 a sample and hold capacitor;
 means for biasing the detector elements so as to provide an analog detection signal from each detector element corresponding to the infrared radiation incident thereon, wherein the analog detection signal is a voltage signal provided at a sample node coupled to the sample and hold capacitor; and
 means for correcting the analog detection signal from each detector element by a discrete offset correction and providing a corrected analog detection signal, wherein the discrete offset correction varies from detector element to detector element and comprises an offset correction voltage added to, or subtracted from, the analog detection signal, wherein said means for correcting subtracts or adds a variable amount of charge from said sample and hold capacitor to provide a corrected voltage signal at said sample node, and wherein said means for correcting
